EXECUTIVE SUMMARY

The Hospital Emergency Department Profile Annual Report 2 (ED-AR2) is a standard report containing emergency department (ED) information released by the Bureau of Emergency Medical Services (BEMS) and The Office of Health Data Analysis (HDA), Utah Department of Health. **The 1996 ED-AR2 is the second report of statewide hospital ED encounter aggregate data in Utah which presents data specifically on those encounters that have resulted in inpatient hospital stays (throughout referred to as EDIP), excluding the ED outpatients data presented in ED-AR1 report recently published by BEMS and HDA offices.** These reports, containing hospital-level all payer data, will serve as the basis for smaller reports on specific topics. The ED data will be used to support evaluation and monitoring of annual ED utilization trends.

During 1996, there was a total of 502,818 encounters to Utah hospital EDs, about 25.1 encounters per 100 persons. The total charge for the 502,818 ED encounters was reported at \$568,634,097 (Table 1). Of the total encounters, 453,331 (or 90.2 percent) visits were made to EDs, with no subsequent admission to facilities with a reported total charge of \$126,142,688. The remaining 49,487 encounters (or 9.8 percent) have resulted in inpatient stays in the facilities (EDIP) with a total cost of \$442,491,409 (Table 1).

Generally, hospital inpatients admitted through the ED are the most severely injured or ill, whose unstable conditions require intensive treatment and monitoring. The most common reasons for being admitted through the ED were diseases of the circulatory system with 19.0 percent of all EDIP (or 9,425 admissions), injury and poisoning with 18.9 percent (or 9,340 admissions), and diseases of the digestive system with 15.5 percent (or 7,653 admissions) (Table 3).

Utah women had a slightly higher proportion of overall inpatient admission through ED as compared with their male counterparts (51.3 percent vs. 48.7 percent). EDIP age distribution was somewhat more evenly distributed across age categories with the expected rise of admissions for very young and very old (Table 2)

Analysis of the 1996 Utah EDIP data (Table 1) showed that number of admissions through ED to urban hospitals was more than four times higher than the number of admissions to rural ones; 38,311 (or 77.5 percent of the total EDIP) and 9,306 (or 18.8 percent of the total EDIP) respectively. Also, the reported total charge associated with EDIP discharges from urban hospitals (\$432,565,335 or 88.1 percent of all EDIP total charges) was more than seven times higher than the total charge associated with EDIP discharges from rural hospitals (\$51,495,510 or 11.9 percent of all EDIP total charges). Diseases of the circulatory system and injury and poisoning have accounted for more than 37 percent of Utah's EDIP (Table 3). The combined total charge associated with diseases of the circulatory system and injury and poisoning in Utah was reported at \$210,063,575, or 47.5 percent of all EDIP charges.

An overwhelming majority of EDIP (36,899 or 74.6 percent) were discharged to home. However, over 20 percent of all patients who were admitted through ED were so severely ill or injured that they were subsequently transferred to a skilled nursing facility, other hospital, or were

discharged to home under the care of a home health agency. Over 3 percent of all EDIP (1,683 or 3.4 percent) died while an inpatient in the hospital (Table 2).

Public insurance (Medicare, Medicaid, and other government sources) was the primary source of payment for 52.9 percent of all EDIP discharges (Table 2). Medicare with 39.7 percent was reported as number one source of primary payer for EDIP discharges. And while over 1/3 of all EDIP discharges were paid by commercial insurers, charity and self pay were reported to be primary payer for only 10 percent of all EDIP discharges.

Of the admissions through the emergency department, 3,099 (or 6.3 percent) were attributed to signs, symptoms and ill-defined conditions (Table 3). Perhaps these and other non-life threatening diseases might be better treated in an outpatient setting where the costs are lower and the primary care coordinated by a primary care giver. Unfortunately, those without such access to outpatient care, may neglect their health until they become severely ill, costing society and employers more than early detection and treatment would have in the first place.

The Hospital Emergency Department Profile Annual Report 2 (ED-AR2), a standard report containing emergency department information, was created through a cooperative effort of the Bureau of Emergency Medical Services, the Health Data Committee and the Office of Health Data Analysis, Utah Department of Health. This report contains data regarding hospital inpatient stays admitted through the hospital Emergency Department. ED-AR2 and its companion report, ED-ARI, which contains information on ambulatory care Emergency Department visits, together represent the entire population of patients seen in the emergency departments of Utah hospitals. The population based emergency department data will be used to support evaluation and monitoring of annual hospital inpatient and ED utilization trends to assist in the development of appropriate injury and illness prevention strategies.

ABOUT THE DATA

The collection of the data for this report is authorized by two statutes (The Utah Emergency Medical Services Systems Act, 26-8, and the Utah Health Data Authority Act, 26-33a, Utah Code Annotated) as well as two statutory committees (The Utah Emergency Medical Services Committee and the Utah Health Data Committee).

The EMS Act authorizes the Bureau of Emergency Medical Services (BEMS) to establish an emergency medical services data system. The data elements are defined by the State Emergency Medical Services Committee (the Committee), relating to the treatment and care of patients, who use or have used, the emergency medical services system (26-8-4(11) and 26-8-5(5)).

Whereas Title 26, Chapter 33a, Utah Code Annotated, established the thirteen-member Utah Health Data Committee (committee). In accordance with the act, the committee's purpose is—

"to direct a statewide effort to collect, analyze, and distribute health care data to facilitate the promotion and accessibility of quality and cost-effective health care and also to facilitate interaction

among those with concern for health care issues."

Administrative Rule R426-1-7(I), enacted in late 1997, mandates that all Utah licensed hospitals submit information on ED patient encounters to BEMS. The rule defines the data elements under administrative rules specifically for the purpose of constructing a statewide Emergency Department Patient Data (EDPD) base.

In an effort to make the reporting of data as convenient as possible for the hospitals statewide, it was determined that the ED patient encounters should be reported in the same format as the hospital inpatient discharge data and could even be submitted by hospitals on the same hospital discharge data tape. This resulted in a situation in which the information for some of the patients admitted to a facility through the ED was contained within the hospital inpatient discharge data base. A cooperative effort between the Bureau of EMS and the Office of Health Data Analysis allowed the two databases to be linked to provide the necessary data without duplicate reporting on the part of the hospitals.

The Emergency Department Patient

Encounter Data Base

Please see ED-AR1 (1998) for complete reporting on the part of the hospitals descriptions of data submission, system edits, and privacy, confidentiality, and data access.

This report includes a wide range of data for use as a tool for analysis of health care issues which specifically relate to the delivery and utilization of hospital inpatient services by patients admitted through the emergency departments of Utah hospitals and excludes the ED outpatients. Consumers, employers, payers, policy-makers, and providers may begin to use this type of data to make health care decisions. Health care reform policies rely heavily on the use of objective, comparable information on different components of the health care industry to drive decision-making by all parties.

ABOUT THIS REPORT

This report provides information on utilization and charges profile of hospital inpatient admissions through ED in Utah during 1996. The data presented in this report were collected from all licensed hospitals in Utah's EDs¹. The data were complied, edited, and analyzed according to the methodology which is documented in this report. The tables contained in this report present the leading conditions and illnesses treated by Utah's hospitals. The major issues addressed by these documents include:

1. volume and intensity of ED use,
2. differences in ED services,
3. differences in patient demographics and complexity among hospitals.

Results

During 1996, there was a total of 502,818 encounters to Utah hospital EDs, about 25.1 encounters per 100 persons. The total charge for the 502,818 ED encounters was reported at \$568,634,097 (Table 1). Of the total encounters, 453,331 (or 90.2 percent) visits made to EDs, with no subsequent admission to facilities, with a reported total charge of \$126,142,688. The remaining 49,487 encounters (or 9.2 percent) have

resulted in inpatient (EDIP) stays in the facilities with a total cost of \$442,491,409. The present report, Emergency Department Annual Report 2 (ED-AR2), presents data on EDIP, excluding the ED outpatient visit (see ED-AR1, 1998 for detailed information on ED outpatient visit).

Patient characteristics

EDIP by patient's gender and age are displayed in Table 2. Utah women comprised a slightly higher proportion of overall inpatient admission through ED as compared with their male counterparts (51.3 percent vs. 48.7 percent). EDIP age distribution was somewhat more evenly distributed across age categories with the lowest admission rate of 2.0 percent for ages between 5-9 and the highest rate of 8.7 percent for ages between 70-75.

Admission characteristics

Geographic regions – Table 1 presents data on EDIP by hospitals' geographic region. As expected, the number of admissions, through ED, to urban hospitals was more than four times higher than the number of admissions, through ED, to rural ones; 38,311 (or 80.5 percent of the total EDIP) and 9,306 (or 19.5 percent of the total EDIP) respectively. Also,

¹ Six hospitals, Veteran Administration Medical Center, Paracelsus Health Care Center, Uintah Basin, Kane County, San Juan, and Tooele Valley, with inpatient data did not submit ED outpatient data in 1996.

the reported total charge associated with EDIP to urban hospitals (\$381,069,825) was more than seven times higher as the reported total charge associated with EDIP to rural hospitals (\$51,495,510).

Major disease categories – As displayed in Table 3, 38 percent (or 18,765) of all Utah's inpatient admissions through ED were attributed to diseases of the circulatory system and injury and poisoning with equal distribution (19.0 percent vs 18.9 percent). The total combined charges associated with diseases of the circulatory system and injury and poisoning injury was reported at \$210,053,575, or 47.5 percent of all EDIP charges. Next to these primary reasons of admissions was diseases of the digestive system with 15.5 percent, or 7,653, of all EDIP with reported total charge of \$64,632,172, or 14.6 percent of all EDIP charges. This is followed by diseases of respiratory system that accounted for 13.3 percent, or 6,588, percent of all EDIP with a reported total charge of \$56,942,127, or 12.9 percent of all EDIP charges.

Injury and poisoning related admissions – Table 4 and 8 present data on EDIP by the intent and mechanism of and type of injury, for the first-listed external cause of injury, at the State and hospital levels. There were 7,409 or 79.3 percent of all injury and poisoning, admissions, through ED, related to unintentional injuries with a reported total charge of \$74,948,395 or 72.6 percent of the total cost of all injury and poisoning charges (Table 4). More than sixty percent of all injury related admissions were caused by falls, motor vehicle crashes, poisoning, and striking against or struck accidentally by object or persons. Unintentional falls accounted for the largest percentage of all injury and poisoning related admissions (35 percent). The average charge for unintentional falls was reported at \$7,974 per discharge. Other frequently reported external causes of unintentional injuries were motor vehicle traffic crashes (18.7 percent),

poisoning (3.7 percent), and striking against or struck accidentally by object or persons (3.4 percent). The associated average charges for each of these unintentional injury categories were reported at \$14,037, \$4,205, and \$7,482 respectively. Although fire and flames and machinery have accounted for only 2.0 percent of all injury and poisoning admissions, the reported average charges (\$17,513 and \$13,960 respectively) per discharge were ranked first and third amongst all injury and poisoning categories (Table 8). Intentional injuries have accounted for 12 percent of all injury and poisoning related admissions with reported average charge of \$6,115 and total charge of \$7,270,757 (Table 8).

Principal Diagnosis - Table 5 presents data on some of the significant principal diagnosis groupings, using the major disease categories specified by ICD-9-CM, for Utah during 1996. As shown in Table 5, the top five reasons of being admitted to a facility through the ED, were pneumonia, heart disease, excluding ischemic heart disease, fracture of lower limb, fractures, excluding lower limb, and chest pain. Pneumonia and heart disease, excluding ischemic heart disease, with 3,116, or 6.3 percent and 3,071, or 6.2 percent were the primary reasons for inpatient admission through ED. This is followed by fracture of lower limb, fractures, excluding lower limb, and chest pain with 2,651, or 5.4 percent, 2,075, or 4.2 percent, and 1,343, or 2.7 percent respectively. However, cost wise, fractures of lower limb and fractures, excluding lower limb with the average cost per discharge of \$11,144 and \$9,915 were reported to be the most expensive treatment given to EDIP. This is followed by noninfectious enteritis and colitis, heart disease, and open wound, excluding head, with an average cost of \$9,801, \$8,334, and \$8,289 per discharge.

Primary Payers – Public insurance (Medicare, Medicaid, and other government sources) was the primary source of payment for 52.9

percent of all EDIP discharges (Table 2). The Medicare with 39.7 percent was reported as number one source of primary pay for EDIP discharges. This is followed by other commercial insurance with 16.1 percent, managed care with 13.7 percent, and the Medicaid with 9.9 percent. While over 1/3 of all EDIP discharges were paid by commercial insurers, charity and self were reported to be primary payer for only 10 percent of all EDIP discharges.

Organization of this Report

There are nine types of tables in this report and the description of each table is included below. The groupings for the tables in this report are derived from the principal diagnosis or patient demographics that were coded by the hospital in the patient record. Each patient ED billing record contains patient demographic, clinical coding classifications based on the International Classification of Diseases, 9th Revision Clinical Modification (ICD9-CM), payer, and utilization data for each admissions.

Categories shown in this report were based on ICD9-CM coding ranges defined in the National Hospital Ambulatory Medical Care Survey: 1996 Emergency Department Summary developed by the National Center for Health Statistics.

This report presents the distribution, composition, and outcome measures of EDIP by selected characteristics. The information is displayed as summary at State level and by individual hospital. Where appropriate, comparative statistics are shown for the hospital's peer group by state. The description of each of the table is as follows:

Table - 1	Presents the State level volume of ED outpatients and inpatients total charges by hospital's geographic regions.
Table - 2	Presents the State level EDIP profile: gender, age, type of admission, discharge status, and primary payer category.
Table - 3	Presents the State level volume of ED inpatient admissions, average, and total EDIP charges by Major Disease Category (MDC) and ICD-9 code range.
Table - 4	Presents the State level volume, average, and total EDIP charges by the general categories of Intent of injury.
Table - 5	Presents the State level volume, average and total EDIP charges by Principal Diagnosis Group and ICD-9 Codes for selected categories.
Table - 6	Presents the hospital level EDIP profile: gender, age, type of admission, discharge status, and primary payer category.
Table - 7	Presents the hospital level volume of EDIP admissions and total ED charges by Major Disease Category (MDC) and ICD-9 code range.
Table - 8	Presents the hospital level volume of EDIP admissions, average, and total ED charges by intent and mechanism of injury categories (E-codes or External Causes of Injury codes) as listed in the ICD-9-CM and type of injury categories (ICD-9-CM code

range 800-989). It is grouped to highlight the interaction between intentionality of the injury and the mechanism that caused the injury.

Table - 9

Presents the hospital level volume of EDIP admissions and average EDIP charges by Principal Diagnosis Grouping and ICD-9 Codes for selected categories.

Description of Table Entries

Using health care data to impact decision making requires a commitment on the part of and type of user to understand the complex nature of health care. Decision making is not simple and cannot be reduced to a single indicator. The entries in the following tables will assist the users in interpreting the information.

EDIP - Number of inpatient admissions, through ED, that occurred from January 1, 1996 to December 31, 1996. These include patients with out of state residencies.

Total Charges - Sum of all ED facility charges included in the billing form, excluding professional fees. This is different from cost of treatment or payment received by the hospital.

Average Charges - Sum of total charges divided by number of discharges. The average lends itself to further mathematical manipulation for example, by multiplying it with a projected number of discharges to predict future resource use. Thus it was chosen over other measures, such as the median or mode, neither of which has this statistical property.

Major Disease Categories - Mutually exclusive principal diagnosis categories. The diagnoses in each MDC correspond to a single organ system or etiology and in

general, are associated with a particular medical specialty.

Outlier - See "Outlier Cases" below.

Gender - Self-explanatory.

Age - Derived from dates of birth and dates of admission to ED.

Limitations

This report shows total billed ED charges. Billed charges are to be used as one indicator of hospitals' ED performances. All patients, or insurance plans, do not pay the same amount for similar treatments, supplies, services, and procedures, even though they may be billed the same amount. Hospitals offer a variety of contracts, many with discount arrangements based on volume.

This report can be used to compare broad measures of EDIP utilization for all hospitals, but more detailed data are needed to look at specific performance comparisons between hospitals. The report addresses EDIP utilization issues, but does not directly measure the quality of medical care. This information serves as an important step toward targeting prevention programs and educating Utahns about their health.

USING THE REPORT

Sources of Hospital Variation in Volume and Outcome of ED Encounters

Users of this report must remember that several factors such as volume of patients encountered, coding inconsistencies, and severity of patient illness can influence comparisons between hospitals. When interpreting the information shown in this report, the reader is advised to keep in mind the following:

Volume

If a hospital released only a few types of certain cases, comparing data with other hospitals would not be especially meaningful because a small number of cases are not sufficient to establish a pattern of treatment. The reader must exercise caution when interpreting measures shown in this report that were based on less than five releases.

Coding

The intra-hospital data variations may be a reflection of the differences in coding practices and quality of data.

The ED Submission Manual provides data element definitions and standards to ensure that all hospitals will report similar data. Additionally, each hospital is provided with a 35-day review period to validate the committee's data against their hospital records.

Despite the validation process, data quality is still a concern, but it is expected to improve over time as hospitals become accustomed to reporting data for public dissemination. Any comparative analysis or decision making, based on this data, should take into account issues of data quality.

Severity of Illness

Patients admission, through EDs, for the same treatment and conditions often vary in the severity of illness. Factors such as age, gender, and secondary illnesses account for differences in severity. Treating severely-ill patients is the most resource intensive and

expensive for any hospital. For instance, patients who are severely ill may need to be admitted to intensive care units; require high-technology equipment; or may need to stay longer in hospitals than patients that are less ill.

Some hospitals, especially regional referral centers such as Primary Children's Medical Center and LDS Hospital, treat more acutely ill patients because of the specialized care available at their facility. The University of Utah hospital, which serves as a regional referral center as well as a major teaching hospital, treats more patients with complex medical conditions than other hospitals. Because of services offered and the condition of patients served, charges for patient care at these hospitals may be higher than at other hospitals.

Rural hospitals often admit a mix of patients that may be chronically ill, uninsured, or elderly. The elderly are often more severely ill because of chronic and multiple health problems than their counterparts.

[The remaining sections are derived from comparative performance of U.S. Hospitals: The Source book, 1992, Health Care Investment Analysts, Inc. (HCIA).]

Size

Larger hospitals typically provide a more extensive array of services that are more sophisticated and resource-intensive than small, rural hospitals, such as specialized intensive care units. In addition to the standby costs of maintaining a broader scope of services, larger hospitals generally treat more complex and severely ill patients. That is, the services that large hospitals produce are different in nature from those produced by small ones.

Furthermore, larger hospitals are typically located in urban areas, which tends to increase costs. Finally, larger hospitals more frequently engage in the provision of graduate medical education and research which results in additional direct and indirect costs not incurred by smaller, non-teaching hospitals.

However, larger hospitals do enjoy several advantages over smaller hospitals. They are better able to attract patients and physicians than smaller hospitals, and the quality of care they provide is perceived as higher. Also, the more ill patients, for whom they care for, are less able to postpone care. That is, a smaller proportion of their patients are elective admissions.

Location

Urban hospitals, compared with rural ones, have higher costs and revenues for a variety of reasons. Cost of labor is among the most important reasons of why urban hospitals incur higher costs when compared with rural hospitals. Hospitals in urban labor markets must typically pay more to employ nurses, administrators, hospital-based physicians, and nearly all other hospital personnel. Primarily because urban hospitals tend to be larger and are faced with greater competition, they generally offer a broader scope of more sophisticated services than do rural hospitals. As a result, urban hospitals generally treat patients requiring more complex care. This further increases their costs when compared with rural hospitals. The inner-city urban hospitals tend to treat a patient mix that is disproportionately poor or elderly compared with suburban hospitals, which tends to increase their costs.

Teaching Status

Teaching hospitals are those that provide medical education, primarily graduate medical education. The most prominent differences between teaching and non-teaching hospitals occur as a result of the contemporaneous provision of teaching and patient care. Teaching hospitals incur certain costs directly associated with medical education programs, the largest category being the salary and benefits expense for interns and residents.

Furthermore, the process of educating interns, residents, and other medical trainees normally results in longer lengths of stay and the use of more ancillary services.

The second major difference between teaching and non-teaching facilities is the broader and more complex scope of services offered by teaching hospitals. Because of the sophisticated service offerings and types of physicians who practice in teaching hospitals, they attract more severely ill patients, who frequently have more complicated diagnoses or are in need of more complex procedures and care.

Strategies to Improve Comparability

All-Patient Refined (APR) DRG

The APR-DRGs are a patient classification scheme developed by 3M Health Information Systems (HIS) that follows the basic DRG methodology of classifying patients into disease categories, but further subdivides each disease category into severity of illness classifications. With a few exceptions, a patient in each disease category (called consolidated DRG) is assigned into one of four levels of severity: no/minor complication or comorbidity (CC), moderate CC, major CC and extreme CC. Some exceptions to the four-level classification are newborns and neonates that are assigned to APR-DRGs formed with the severity of condition already built-in (e.g., APR-DRG 606: Neonate, birth weight 1000-1499g with significant O.R. procedure, released alive.)

APR-DRG categories were used to define charge outliers and calculate the Case Mix Index (See Case Mix Index).

Outlier Cases

Some patients have exceptionally low or high total facility charges. A hospital's charges can be affected by just a few unusually expensive (or inexpensive) cases. These high or low values could be a result of coding or data submittal errors, particularly in total charges, or data elements that effect DRG assignments. Other reasons for exceptionally low charges could be due to death or transfer to another

facility. Exceptionally high charges could be due to a catastrophic condition. Whatever the reason, these values, referred to as "outliers," distort the averages and were excluded from calculations. The high total facility charge outliers are defined in this and succeeding reports as values above 2.5 standard deviations from the mean. Means and standard deviations are APR-DRG specific and calculated on a statewide basis. The low outliers were defined as a non-newborn or non normal delivery encounter with less than \$300 charge. However, the calculations in this report do not exclude low outliers. A preliminary analysis showed that of the encounters meeting this definition, a high proportion are in the DRG "Other factors influencing health status," for which it was difficult to determine whether they were true outliers.

Case-Mix Index

An important source of variation among hospitals in a summary measure of outcome - such as length of stay, total charges, and severity of illness - is the differences in the complexity of the patients they treat. To allow for a meaningful comparison of outcome measures between hospitals, an adjustment factor based on patient complexity should be applied. Therefore, four case-mix indices (all-patient, acute, obstetric, and pediatric) have been calculated for each hospital and are shown on the tables in this report. A hospital's case-mix index of 1.15 means that the overall case mix of a hospital requires 15 percent greater intensity of resource use relative to the state as a whole. See Appendix A for a description of the calculation of the case-mix indices.

Hospital Peer Groups

Comparing summary outcome measures (length of stay, total charges, readmission rates, mortality rates) among hospitals has always been controversial because of the difficulty of defining what makes hospitals "comparable." As discussed previously, summary outcome measures vary among hospitals depending on various factors such as location, bed size, ownership, affiliation, and teaching status. If all these factors were to be

considered in defining peer groups, each hospital might end up in a group by itself.

The question is, "Why define peer groups at all?" The answer is that given hospital-level data, users tend to compare hospitals. Without peer groupings to reference, readers would compare a hospital with either the state level data or another arbitrarily chosen hospital.

It was determined that this report would contain summary statistics for a hospital's peer group as well as for the hospital and the state. The next issue was the basis for the grouping, which is discussed below.

Among various factors which affect a hospital's average charges, location and case mix indicators play important roles in determining the complexity of patients treated in the hospital. Therefore, the bases for the 1993 hospital grouping are location (urban/rural) and the all-patient case-mix index, except for psychiatric and substance abuse hospitals and non-comparable hospitals.

The hospitals are assigned to peer groups according to 1996 UHDB all patient case-mix index (CMI). The 1996 UHDB all patient CMI is shown below.

Group 1: Acute Care, Urban, High CMI

LDS Hospital	1.4475
University of Utah Hospital & Clinics	.3357

Group 2: Acute Care, Urban, Upper Medium CMI

St. Mark's Hospital	1.1155
McKay-Dee Hospital Center	1.0659
Salt Lake Regional Medical Center	0.9747
Utah Valley Medical Center	1.0635

Group 3: Acute Care, Urban, Lower Medium CMI

Cottonwood Hospital Medical Center	0.7741
Davis Hospital and Medical Center	0.7130
Lakeview Hospital	0.9416
Mountain View Hospital	0.8149
Ogden Regional Medical Center ..	0.8883
Pioneer Valley Hospital	0.8875

Group 4: Acute Care, Urban, Low CMI

Alta View Hospital	0.6263
American Fork Hospital	0.5710
PHC Hospital	0.8017
Jordan Valley Hospital	0.5665
Orem Community Hospital	0.4337

Group 5: Acute Care, Rural, High CMI

Ashley Valley Medical Center	0.6986
Brigham City Community Hospital	0.8371
Castleview Hospital	0.9461
Dixie Medical Center	0.8308
Logan Regional Hospital	0.6477
Valley View Medical Center	0.6812

Group 6: Acute Care, Rural, Low CMI

Allen Memorial Hospital	0.5736
Bear River Valley Hospital	0.5888
Beaver Valley Hospital	0.5328
Central Valley Med Center	0.6238
Delta Community Medical Center ..	0.5608
Fillmore Community Med Center ..	0.5371
Garfield Memorial Hospital	0.5426
Gunnison Valley Hospital	0.5147
Kane County Hospital	0.5698
Milford Valley Memorial Hospital ..	0.4786
San Juan County Hospital	0.5427
Sanpete Valley Hospital	0.5698
Sevier Valley Hospital	0.6262
Tooele Valley Regional Med Center ..	NA
Uintah Basin Med Center	0.6286
Wasatch County Hospital	0.5749

Special Hospitals (not comparable)

Primary Children's Med Center	1.47

Future Reports

The ED-AR2 report contains a wealth of data and will serve as the basis for several consumer-friendly reports. Standard documents will be published and distributed to a wide range of audiences.

Electronic Data

BEMS supports legitimate access to its emergency department data base while protecting the patient, and hospital right of privacy.

Public Data Sets (PDS) are available with minimal controls. Different data files are designed to provide general health care data to a wide spectrum of users.

User Defined Data Set (UDDS) is available through the “Request for Data Release” process. Researchers may request, in writing, a research oriented database for bona fide research and statistical purposes. BEMS will forward these requests to the Department of Health Institutional Review Board for review and approval.

Special Data requests will be reviewed jointly by OHDA and BEMS.

For information or data request, contact:

APPENDIX A

Case-Mix Index

The case-mix indices were derived as follows:

1. Calculate relative weight for each APR-DRG i :

$$W_i = \frac{C_i}{C_s}$$

where:

i = APR-DRG i

s = State Level

W_i = Relative weight for APR-DRG i

C_i = Average charge for APR-DRG i

C_s = Average charge for all patients

2. Calculate case-mix index for hospital j :

$$I_j = \frac{\sum_{i=1}^{1315} W_i N_{ij}}{N_j}$$

where:

j = Hospital j

I = Case-Mix index for hospital j

N_{ij} = Number of discharges for APR-DRG i and hospital j

N_j = Total discharges for hospital j

In the calculation of all the case-mix indices, the following were excluded: higher outliers and discharges from psychiatric and substance abuse hospitals, South Davis Community Hospital, Bonneville Health and Rehabilitation, HEALTHSOUTH Rehabilitation Hospital of Utah, Veterans Hospital, and Utah State Hospital. Besides

the above exclusions, the discharges included in each of the case-mix indices are described below:

All-Patient Case-Mix Index: All discharges

Acute Case-Mix Index: All discharges but excluding newborns (ICD-9:V30-V39).

Obstetric Case-Mix Index: Discharges assigned Major Diagnosis Category (MDC) 14 (Pregnancy, Childbirth, & the Puerperium)

Pediatric Case-Mix Index: Patients aged 0-17, excluding newborns.

APPENDIX B

Electronic Resource Documents

Public Data Sets (PDS) are available with minimal controls. Different data files are designed to provide general health care data to a wide spectrum of users. Although the data is at the patient level, considerable care has been taken to ensure that no individual patient could be identified from the data. The data elements included in the public use data files are listed below.

- 1 Provider Identifier (Hospital)
- 2 Patient's age (in 5-yr. group)
- 3 Patient's gender
- 4 Source of admission
- 5 Total hours stay
- 6 Patient's release status
- 7 Patient's postal zip code
- 8 Patient's residential county
- 9 Patient's migrant status
- 10 Patient's marital status
- 11 Patient's race
- 12 Patient's ethnicity
- 13 Principal diagnosis
- 14 Secondary diagnosis 1
- 15 Secondary diagnosis 2
- 16 Secondary diagnosis 3
- 17 Secondary diagnosis 4
- 18 Principal procedure
- 19 Secondary procedure 1
- 20 Secondary procedure 2
- 21 E CODE
- 22 Admission Hour
- 23 Total charge
- 24 ED Charge
- 25 Primary payer category
- 26 Secondary payer category
- 27 Tertiary payer category
- 28 Patient's relationship to insured
- 29 Charge Outlier
- 30 Length of Stay Outlier
- 31 Release Quarter
- 32 Secondary diagnosis code 5

- 33 Secondary diagnosis code 6
- 34 Secondary diagnosis code 7
- 35 Secondary diagnosis code 8
- 36 Secondary procedure code 3
- 37 Secondary procedure code 4
- 38 Secondary procedure code 5

User Defined Data Set (UDDS) is available through the “Request for Data Release” process. BEMS supports legitimate access to its ED data base while protecting the patient and hospital right of privacy. To ensure the patient privacy, all requests for data release not in aggregated form shall be submitted in letter form to the BEMS director, specifically stating the purposes for which the data is requested. Researchers may request, in writing, a research-oriented database for bona fide research and statistical purposes. BEMS will forward these requests to the Department of Health Institutional Review Board for review and approval.

Please send requests for data to:

Bureau of Emergency Medical Services
Utah Department of Health
288 North 1460 West
PO Box 142004
Salt Lake City, UT 84114-2004
(801) 538-6011

Special Data requests will be reviewed jointly by OHDA and BEMS.

Table 3
ED-Inpatient by Major Disease Category
January 1, 1996 to December 31, 1996

Major Disease Category and ICD-9 Code Range*		Number of ED-Inpatients	State Average	Total Charges
Infectious and parasitic diseases	001-139	1,732	\$8,199	\$15,934,134
Neoplasms	140-239	721	\$11,974	\$9,653,699
Endocrine, nutritional, metab. & immunity disorders	240-279	1,898	\$4,996	\$10,371,892
Diseases of the Blood and Blood-Forming Organs	280-289	354	7,776	\$3,071,421
Mental disorders	290-319	3,264	\$6,179	\$23,371,323
Diseases of the nervous system and sense organs	320-389	624	\$7,108	\$5,310,754
Diseases of the circulatory system	390-459	9,425	\$10,580	\$106,877,565
Diseases of the respiratory system	460-519	6,588	\$7,672	\$56,942,127
Diseases of the digestive system	520-579	7,653	\$7,707	\$64,632,172
Diseases of the genitourinary system	580-629	1,873	\$4,768	\$9,553,368
Complications of pregn., childbirth, & puerperium	630-677	888	\$3,739	\$3,640,528
Diseases of the skin and subcutaneous tissue	680-709	669	\$5,375	\$4,095,693
Diseases of the musculoskeletal sys. & conn. tissue	710-739	732	\$6,798	\$5,540,509
Congenital Anomalies	740-759	119	\$10,992	\$2,033,691
Certain conditions orig. in the perinatal period	760-779	270	\$4,110	\$1,339,716
Symptoms, signs, and ill-defined conditions	780-799	3,099	\$4,309	\$14,128,756
Injury and poisoning **	800-999	9,340	\$9,771	\$103,176,010
Supplementary classification	V01-V82	158	\$8,168	\$1,925,854
All other diagnoses		80	\$9,179	\$892,197
All Visits		49,487	\$8,942	\$442,491,409

* Based on Principle Diagnosis.

** See Table 4 for general categories of injury and poisoning.

Table 4
ED-Inpatient Hospitalizations Due to Injury or Poisoning
January 1, 1996 to December 31, 1996

Intent & Mechanism of Injury*		Number of Visits	State Average	Total Charges
Unintentional injuries	E800-E869, E880-E929	7,409	\$9,250	\$74,948,395
Intentional injuries	E950-9, E960-9, E970-9, E990-9	1,125	\$6,115	\$7,270,757
Injuries of undetermined intent	EE980-E989	20	\$6,092	\$137,098
Adverse effects of medical treatment	E870-E879, E930-E949	2,412	\$9,893	\$27,631,447
Unknown		66	\$7,377	\$596,372

Note: Outliers were excluded in the calculation of average charges. See text.

* Based on ICD-9 E Code

Table 5
ED-Inpatient Hospitalizations by Top-Volume Diagnostic Categories
January 1, 1996 to December 31, 1996

Principle Diagnosis Group and	ICD-9 Codes	Number of Visits	State Average*	State Summary
Diabetes	250.0-250.9	754	\$5,648	\$4,577,886
Otitis media and Eustachian tube disorders	381-382	13	\$2,463	\$32,022
Heart dis. excl. ischemic	391-392.0,393-398,402, 404,415,416,420-429	3,071	\$8,334	\$27,796,590
Acute upper respiratory inf., excl. pharyngitis	460-461,463-466	733	\$3,922	\$ 3,173,027
Acute pharyngitis	462	11	\$2,864	\$31,501
Pneumonia	480-486	3,116	\$7,577	\$27,195,309
Chronic and unspecified bronchitis	490-491	387	\$6,637	\$2,859,298
Asthma	493	832	\$4,232	\$3,753,180
Noninfectious enteritis and colitis	555-558	376	\$9,801	\$4,079,316
Urinary tract infection , site not specified	599.0	459	\$4,690	\$2,347,762
Dorsopathies	720-724	253	\$5,919	\$1,498,057
Rheumatism, excluding back	725-729	122	\$6,144	\$1,141,751
Convulsions	780.3	341	\$4,899	\$1,764,771
Headache and migraine	784.0,346.90	51	\$3,898	\$194,911
Chest pain	786.5	1,343	\$4,155	\$5,820,098
Abdominal pain	789.0	488	\$3,590	\$1,705,342
Fractures, excluding lower limb	800-819	2,075	\$11,144	\$24,581,487
Fracture of lower limb	820-829	2,651	\$9,915	\$27,812,868
Sprains and strains, excluding ankle and back	840-844,845.1,848	33	\$5,413	\$178,618
Sprains and strains of ankle	845.0	4	\$3,914	\$15,655
Sprains and strains of back	846-847	70	\$2,844	\$199,066
Open wound of head	870-873	145	\$5,445	\$843,071
Open wound, excluding head	874-897	306	\$8,289	\$2,775,618
Superficial injury	910-919	16	\$4,726	\$75,612
Contusion with intact skin surface	920-924	121	\$3,979	\$506,976
All other		31,756	\$8,359	\$297,531,619

Note: Outliers were excluded in the calculation of average charges. See text.

* Excludes professional fees, which in 1996, averaged \$229 for urban and \$207 for rural hospitals.
